Summary Of the Analysis

This paper represents an analysis of White House visitor access logs from June to October 2022. The objective is to identify patterns and provide operational recommendations.

Audience

The audience for this analysis is operations managers and security screening supervisors White House Visitor Access Office. These stakeholders have the information about operational metrics such as daily volume, staffing levels, peak periods however do not typically engage directly with raw visitor access datasets.

Purpose

This analysis purpose is to reveal visitor access demand follows stable and repeatable patterns by date, time or meeting location. This story includes a call to action to transition from specified staffing models toward demand based staffing strategies rather than serving as a purely descriptive exercise.

Medium

The medium is PDF report with six visualizations. This format reflects how operational reviews are commonly communicated within organizational settings and allows decision makers to review visual evidence alongside concise interpretation.

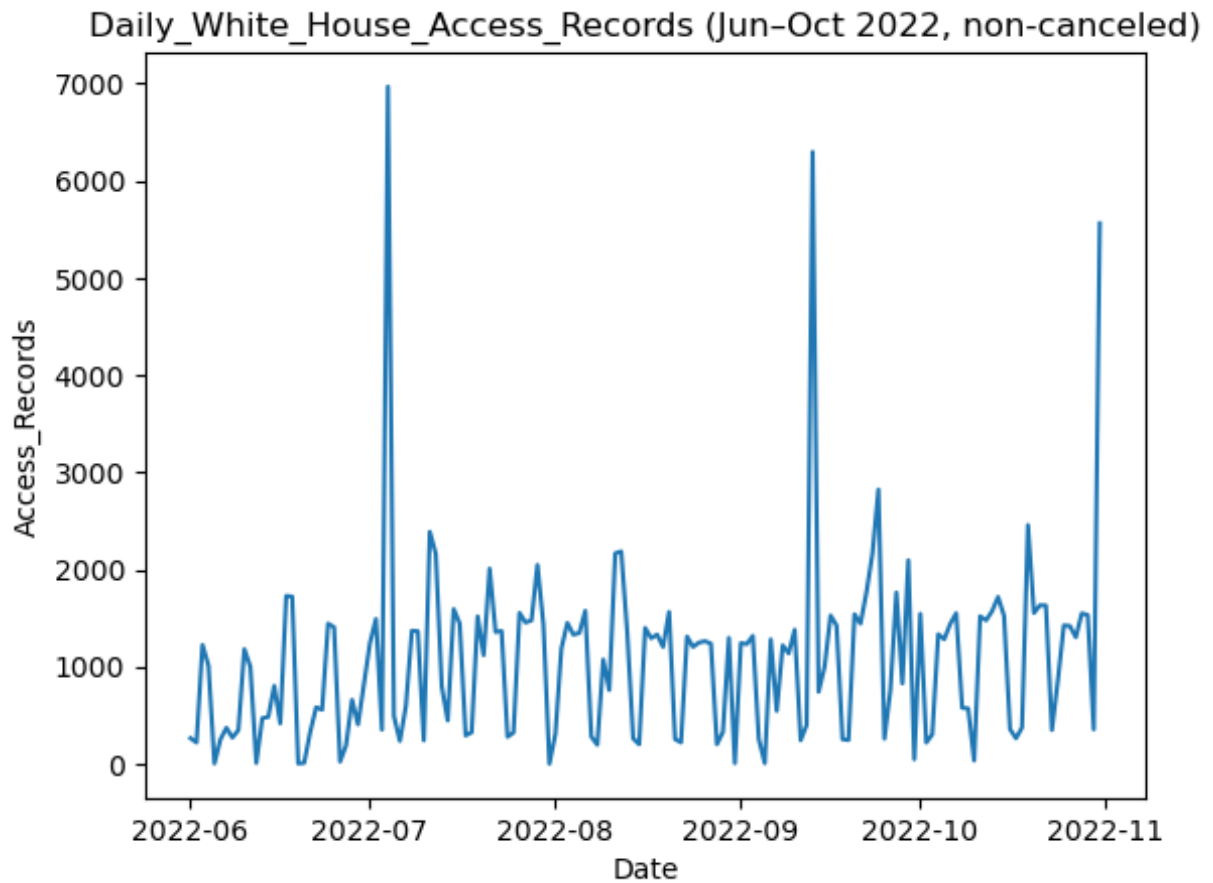

Design

It also adheres to the Gestalt principles. Proximity is achieved by ensuring each graph is placed right beside its description. Similarity and alignment can be seen by ensuring that all charts are of equal size. Figure ground can be achieved by making sure that simple color schemes with clear axes are used, making sure that emphasis is on the graph.

Visualizations

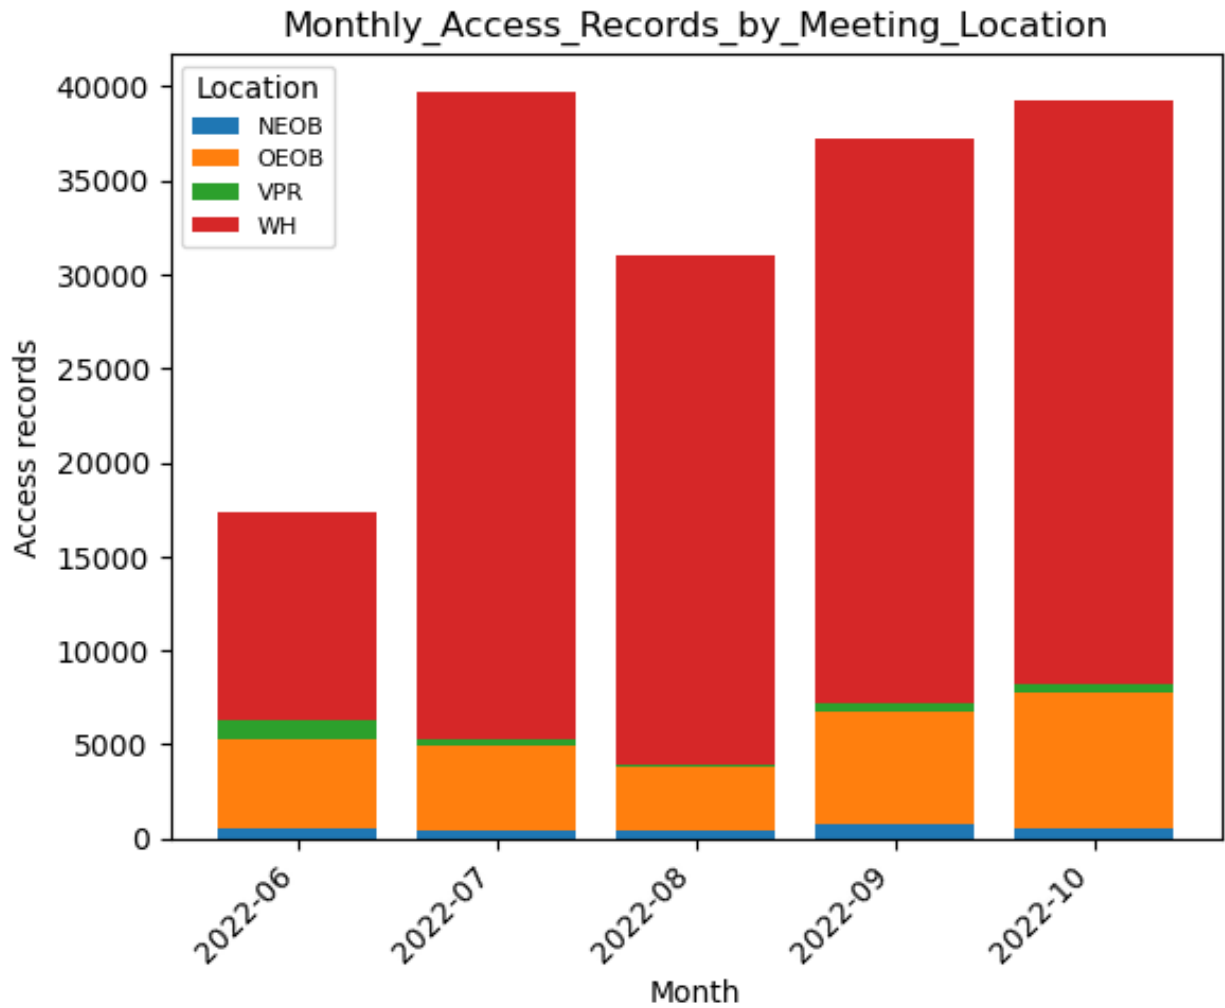

There are six different visualization as listed below.

1. Daily White House access records (line chart)

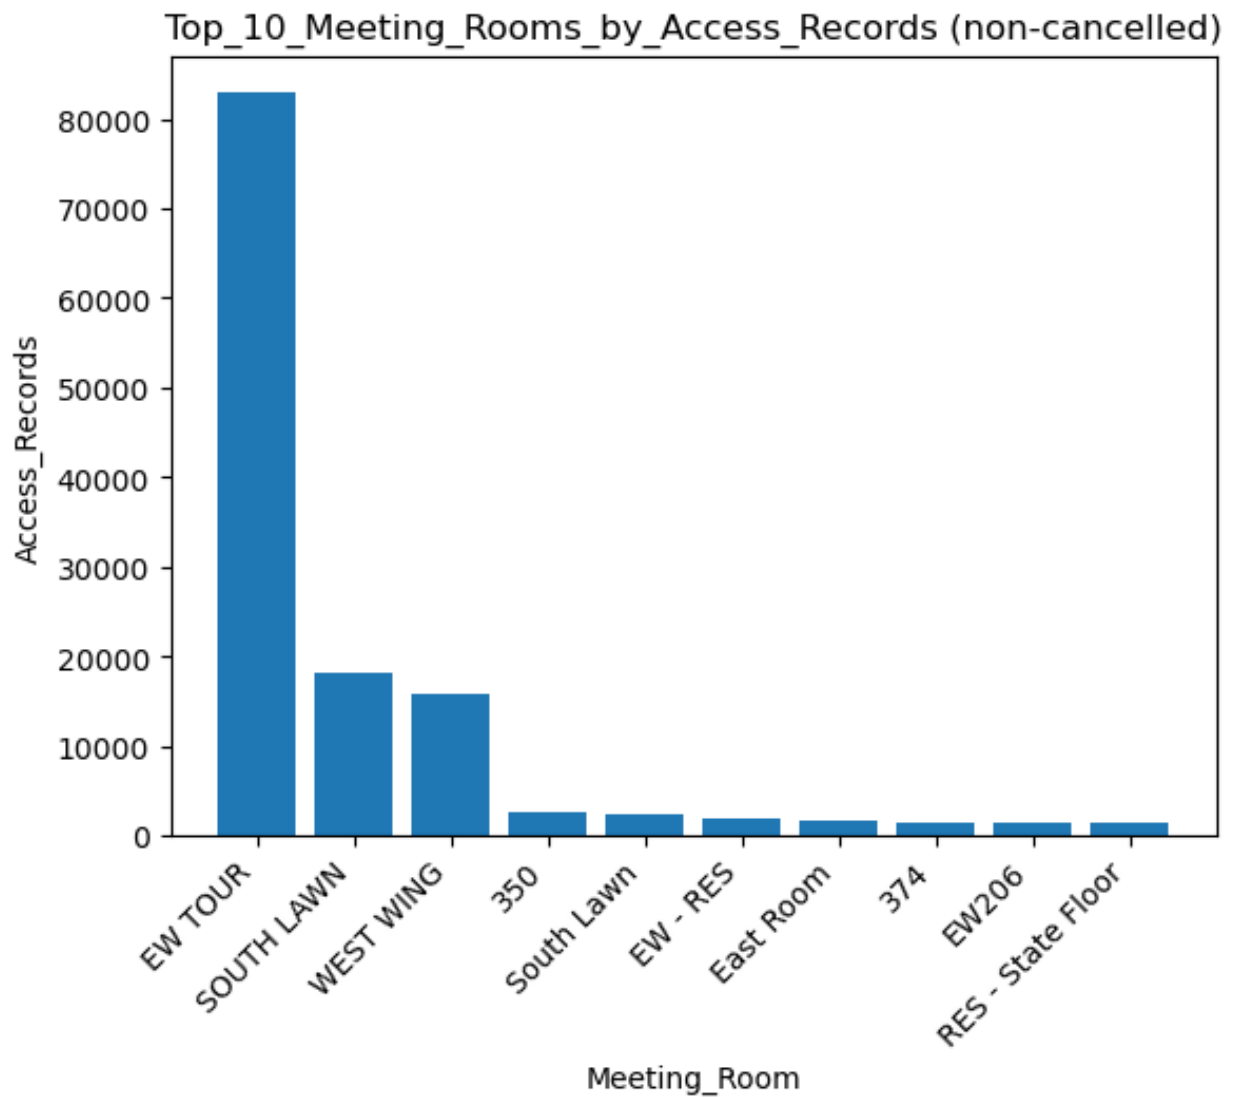

This charts shows some days sharp peaks based on daily non-canceled access records, however the overall pattern is consistent, establishing a reliable workload baseline.

2. Monthly access records by meeting location (stacked bar chart)

This chart shows that a small number of locations consistently account for the majority of access activity.

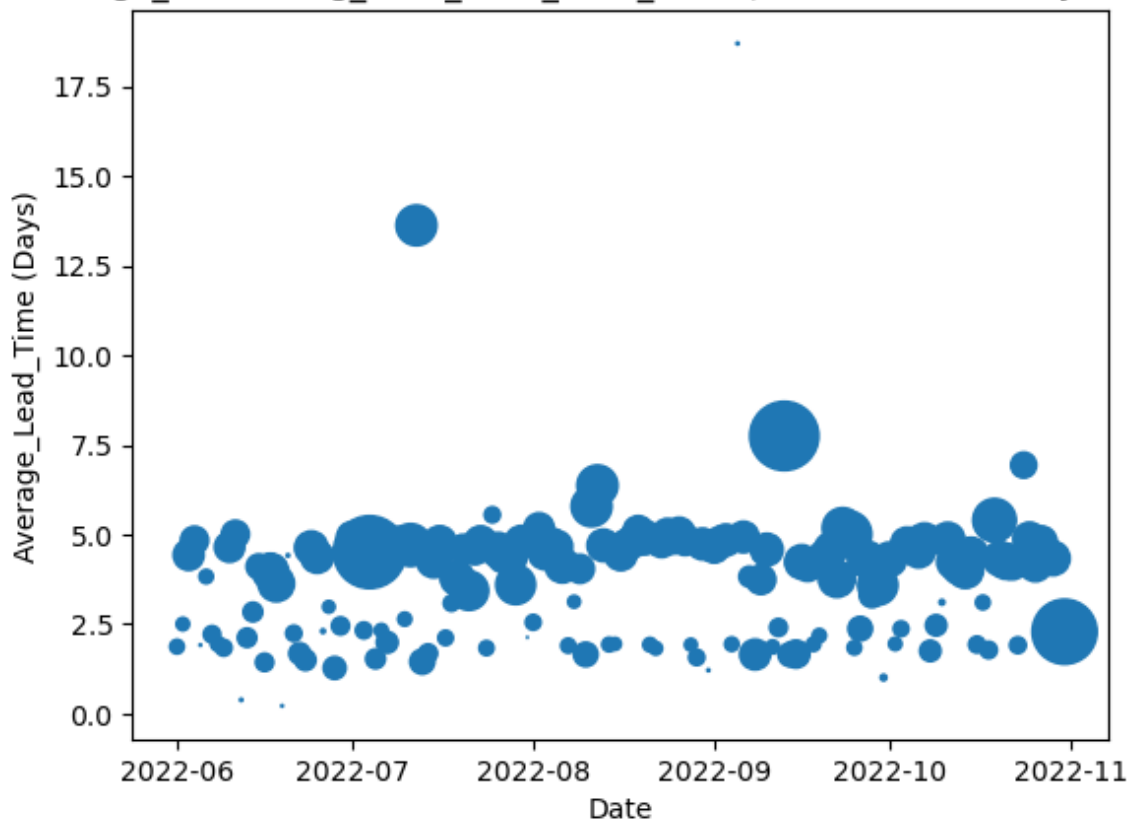

3. Top 10 Meeting Rooms (Bar chart)

It shows the EW Tour has higher access record than equal distribution..

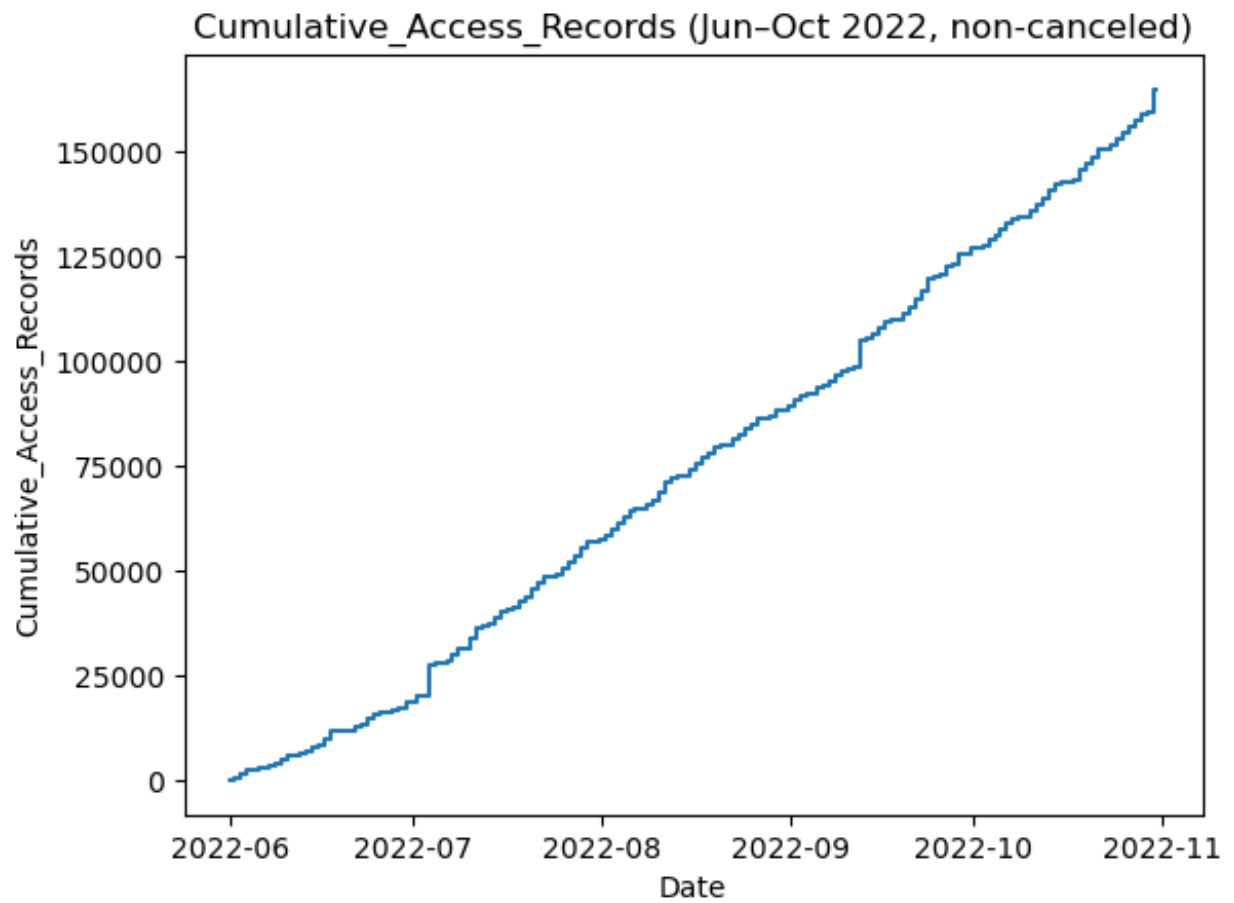

4. Average scheduling lead time over time (Scatterplot)

Average_Scheduling_Lead_Time_Over_Time (Marker size ~ Daily volume)

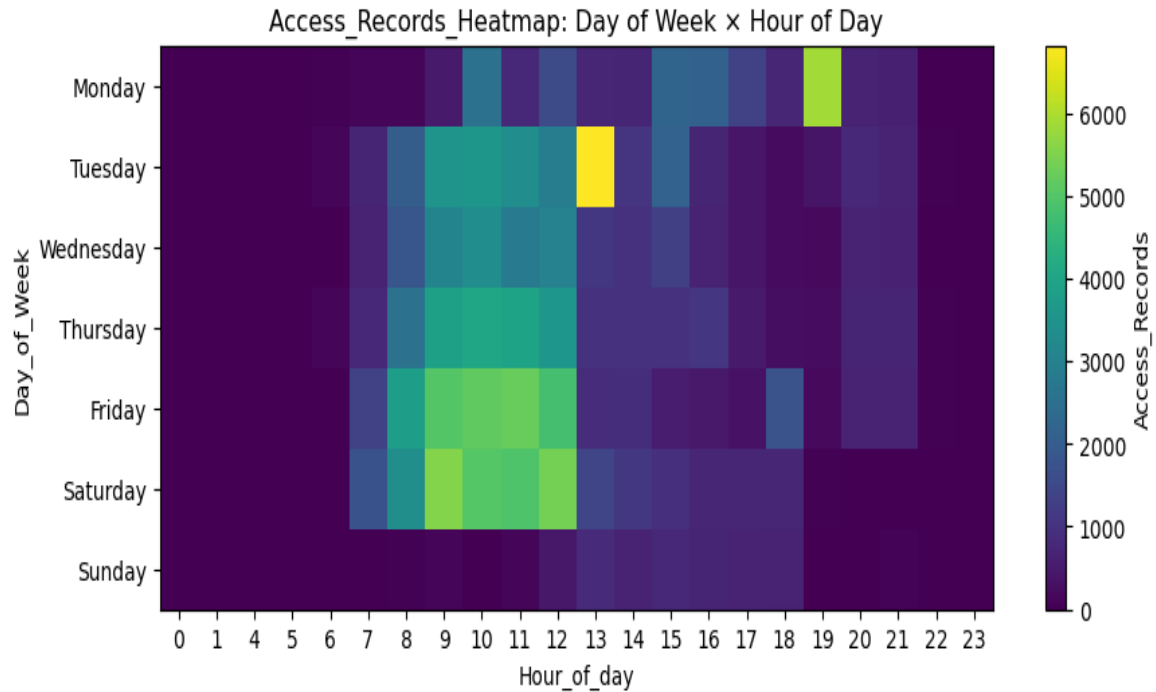

It indicates daily volume, illustrating that short-notice visits persist even on high-volume days.

5. Cumulative access records (Step chart).

The steady upward trend indicates sustained and predictable demand.

6. Access records by day of week and hour of day (Heatmap)

This heatmap displays clear weekday, business hour peaks and also pinpointing when staffing pressure is most significant.

Findings

This visual analysis reveals visitor access demand is predictable, location driven & time dependent.

Conclusion

The proactive, data informed staffing and scheduling adjustments could reduce bottlenecks without compromising security.

Ethical Considerations

This includes standardization of the column names, the analysis of dates, the elimination of canceled visit records and those without appointment times, and data aggregation to control the exposure of personally identifiable information. The data derived from the open source white house visitor records, all of which were for research use only.
