1. Introduction

In this research, we will figure out global viewership trends, identify cross country patterns, evaluate performance by utilizing 3 different Netflix top 10 public datasets. we will create six different visualizations to find out the meaningful insights which could guide content investment decisions. This narrative will highlights the types of content which sustain global attention and concludes with a strategic recommendation to Netflix.

2. Audience, Purpose, and Medium

For this project, I assumed the role of a Netflix data analyst is preparing for insights for high level Content and Strategy executives. This audience understands high-level business metrics but does not work directly with Python or raw datasets.

The purpose of the analysis is to present how Non-English TV series and globally distributed franchises consistently generate strong and sustained viewership. The call to action is for leadership to increase investment in Non-English TV content and multi-season franchises that have demonstrated global traction.

This written report gives the visuals as well as insights in a structured and accessible format aligned with assignment requirements.

3. Data Sources and Data preparation

In this project, three datasets from the Netflix Global Top 10 libraries were used which are:-

1. **All weeks Global Netflix Dataset:** Provides weekly global viewership across categories like Films, TV, English, Non-English.
2. **All weeks Countries Dataset:** Shows per country weekly rankings of titles.
3. **Most Popular Dataset:** Includes viewership totals and rankings for the top 40 titles globally.

Data preparation:

Week fields was converted to datetime format, text valued is cleaned. Data was grouped by category, county, title. Some derived fields was created like distinct counts and data was merged as needed.

All analysis was performed using Python.

4. Visualizations and Insights

4.1 Global Weekly Hours Viewed by Category

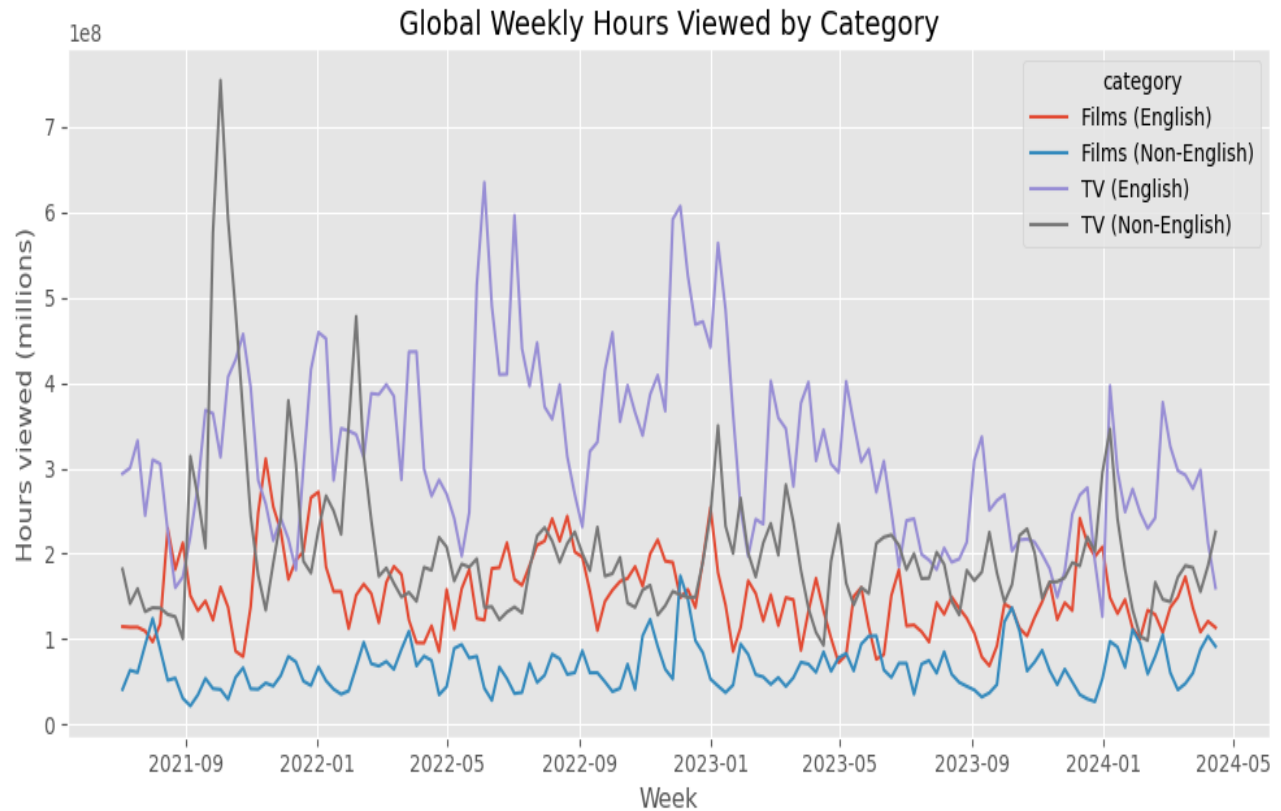

Figure 1: Global Weekly Hours Viewed by Category

This visualization shows, global engagement with four different key categories. TV (English) leads consistently for the highest number of weekly hours viewed over the full timeline and TV (Non-English) demonstrates strong & rising performance with several peak periods rivaling English language TV. Both film English and Non-english category shows significantly lower weekly engagement compared to TV show. There are indications from these patterns that serialized content drives the most global watch time.

4.2 Weekly TV Hours Viewed – English vs Non-English

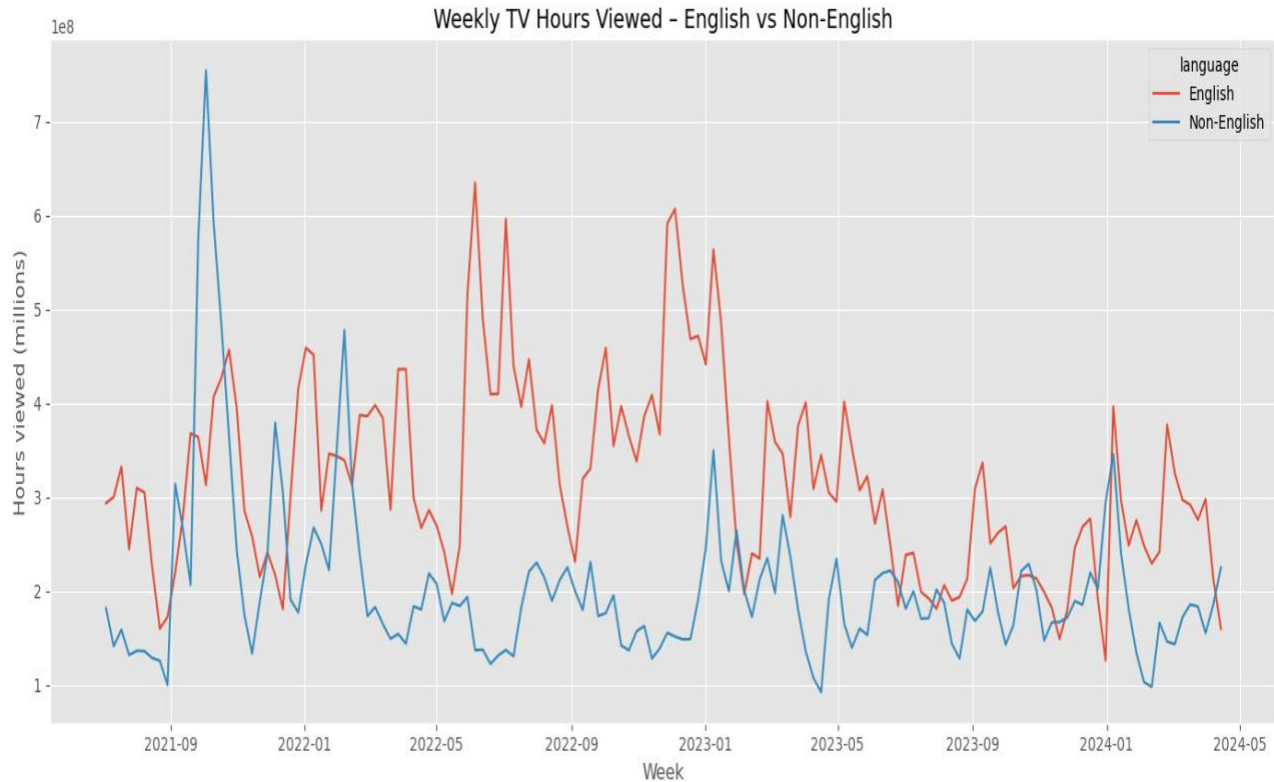

Figure 2: Weekly TV Hours Viewed – English vs Non-English

It shows a comparison between English and Non-English TV views. Both categories indicates consistent engagement regardless English TV maintains higher weekly hours especially during peak release periods. However, Non-English TV also demonstrates significant spikes, reaching over 700 million weekly hours at certain points—showing that international TV content can achieve global breakout performance.

The presence of these lines confirms, audience demand is not limited to English language content. Instead, viewers regularly watch Non-English series at scale.

4.3 Weeks in Top 10 by Country & Category (Heatmap)

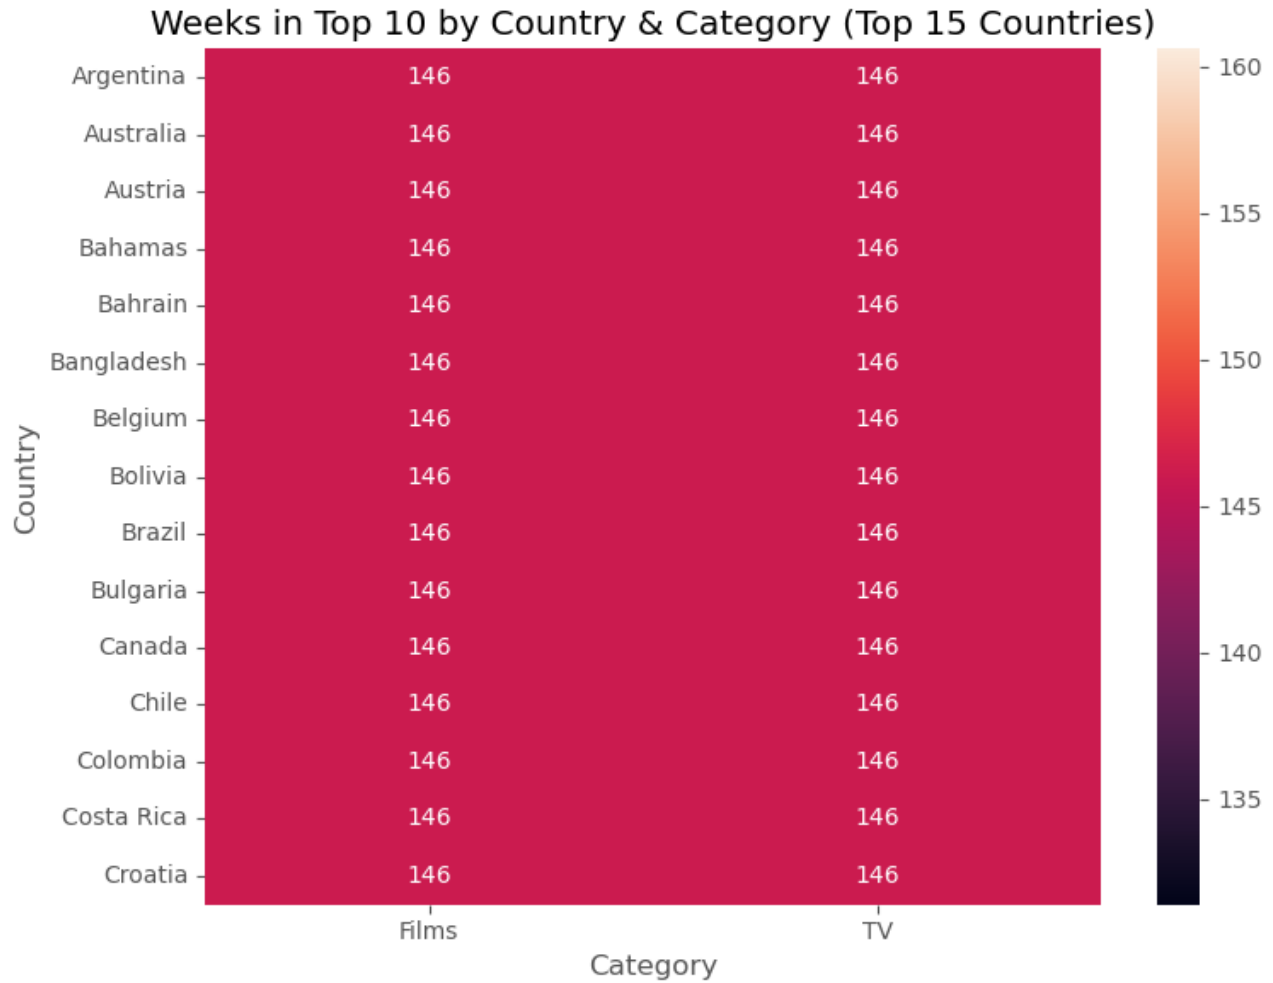

Figure 3: Weeks in Top 10 by Country & Category (Heatmap)

It makes the heatmap more uniform since each country of the top 15 accumulated equal numbers of weeks in the dataset for Films and TV, due to a structural artifact of how Netflix publishes weekly entries. As expected, this limits differentiation between the categories, yet it still confirms that all countries represented here had full weekly reporting and were consistently participating in both categories' global ranking cycles.

4.4 Most Popular Titles – Number of Countries Where in Top 10

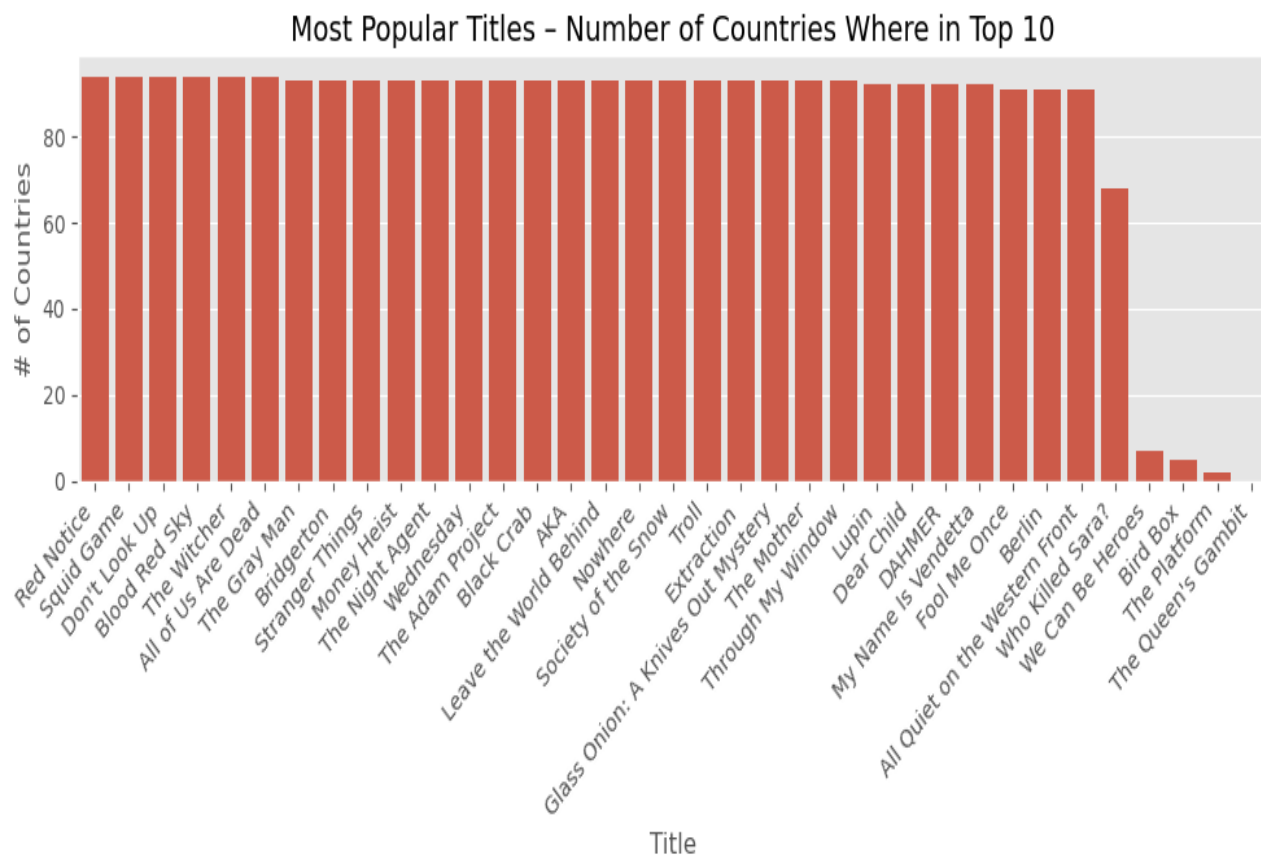

Figure 4: Most Popular Titles – Number of Countries Where in Top 10

Many of the top-performing titles reached 80+ countries, which means a really outstanding global outreach. Titles such as Red Notice, Squid Game, and All of Us Are Dead ranked very high across regions. This cements the value of developing content with broad international appeal and suggests that the most successful Netflix titles resonate well beyond their origin countries.

4.5 Views vs Hours Viewed (Most Popular Titles)

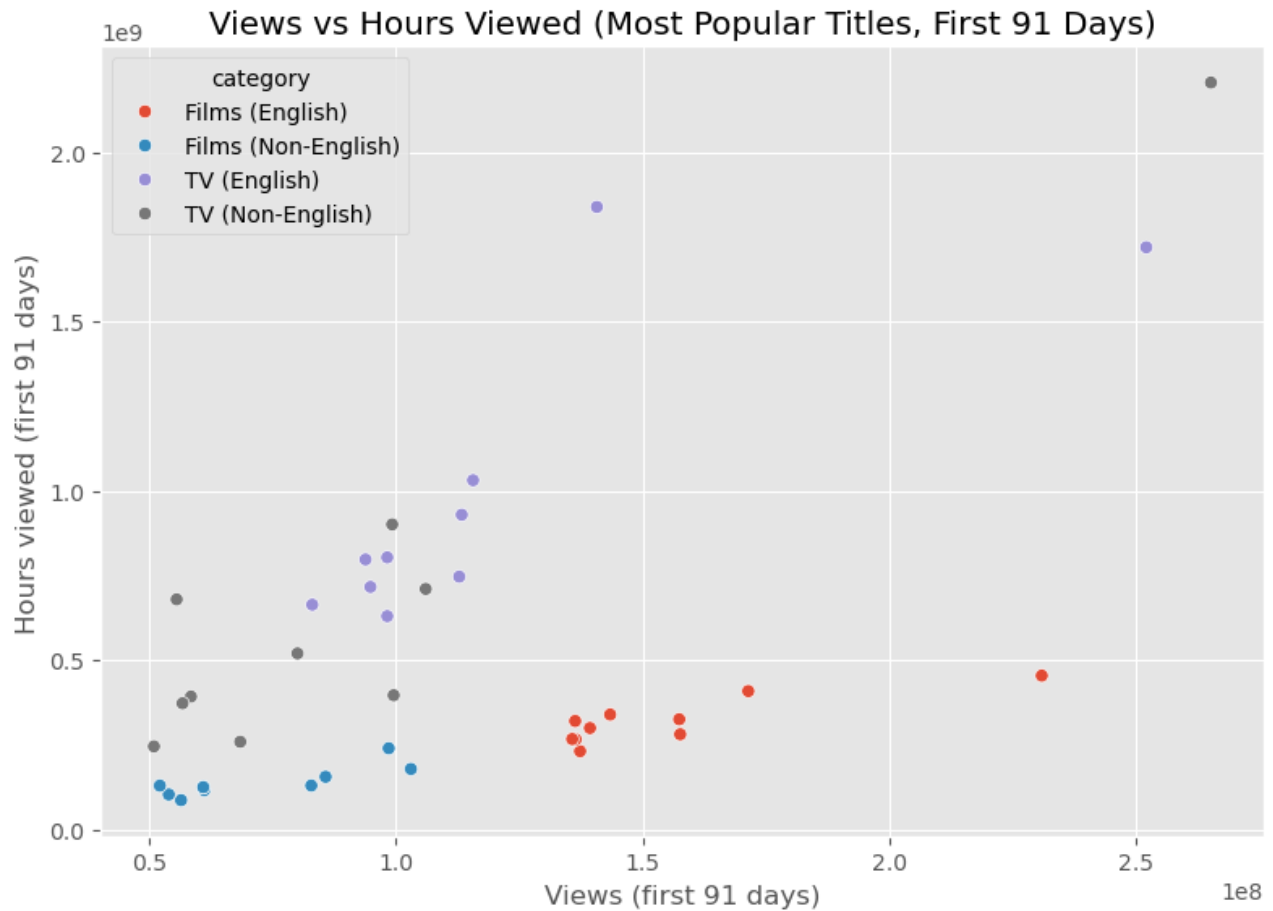

Figure 5: Views vs Hours Viewed (Most Popular Titles)

There is a strong differentiation in the scatterplot between Films and TV series. The TV titles, especially Non-English ones, amass much more total hours viewed despite similar or even lower early view counts. This is because the TV series predisposes one to binge-watching and viewing several episodes. The relationship seems to indicate that franchise-style TV content delivers substantially more hours of long-term engagement than films.

4.6 Top 10 Countries by Number of Distinct Titles in Weekly Top 10

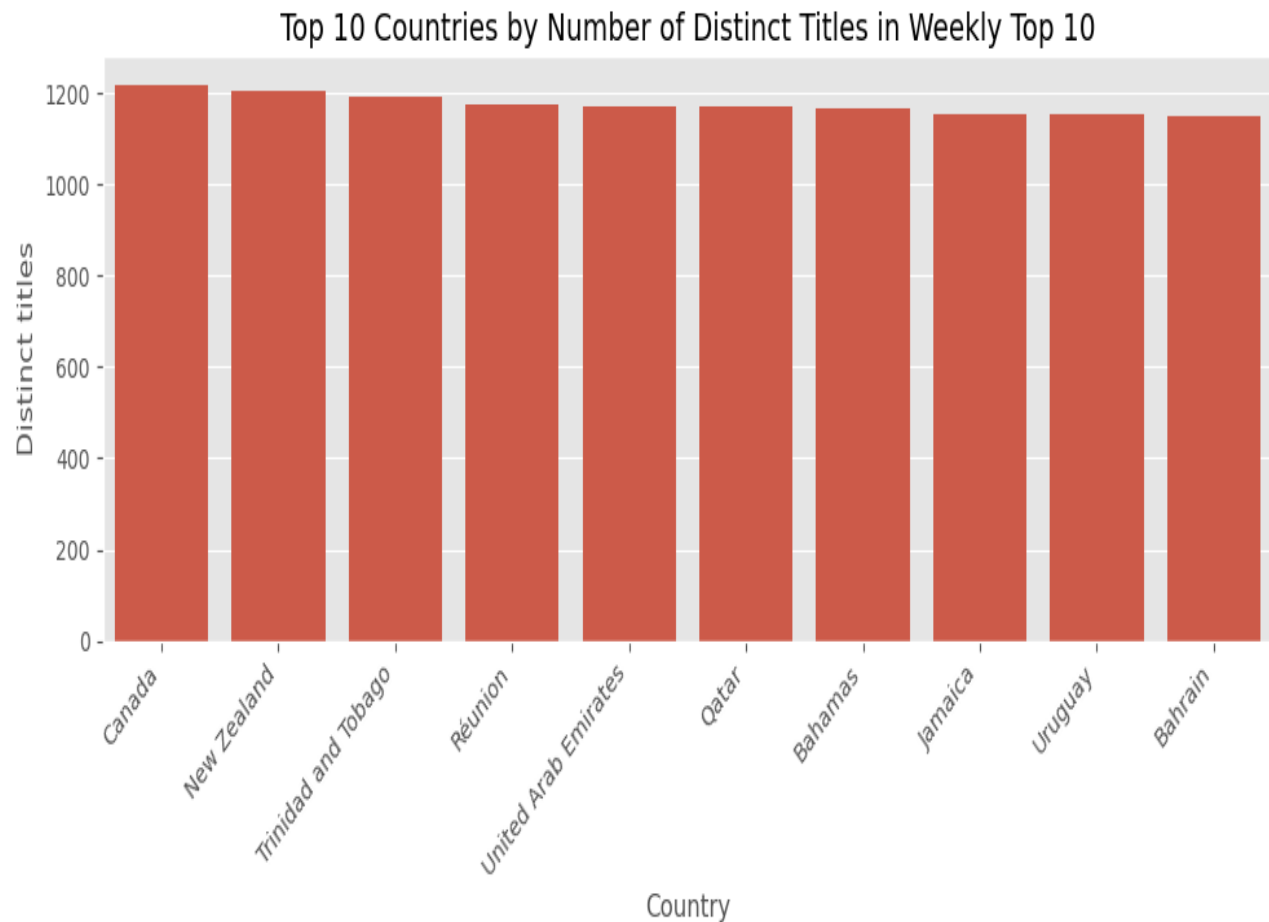

Figure 6: Top 10 Countries by Number of Distinct Titles in Weekly Top 10

Countries like Canada, New Zealand, Trinidad and Tobago, Reunion, and UAE have extremely high diversity in the titles that made their Top 10 lists, with more than 1,100+ unique titles each. This openness to a varied content library signals that internationally, regions provide strong demand for a broad mix of genres and languages, supporting further investment in globally distributed content.

5. Conclusion:

By analyzing all visualizations, we found that TV series-both English and Non-English drive the majority of global engagement on Netflix. English language shows sustain higher overall viewing levels and Non-English TV reaches strong and frequent spikes, which is proving international content can attain global blockbuster status. Netflix has strongest future growth

opportunities rest in expanding its international TV catalog and investing in franchises that sustain viewer attention across several weeks.

6. Strategic Recommendation

Netflix should consider increasing investments in Non-English TV series and multi-season franchises that work globally. In fact, the data here shows that not only has international TV content captured a big audience, but spikes in this genre also compete with top English shows. Netflix can optimize watch time, improve subscriber retention, solidify its position by scaling up production partnerships with high-performing areas and developing multi-season arcs.

7. Design Choices

TV shows was separated with movies and English language with non-English language content by using a constrained and uniform color. , Titles were centered for ease of reading, body text was right or left aligned and there was enough space to avoid crowding. This method supports executive level comprehension by guaranteeing clarity and ease of comparison among visualizations.

8. Ethical Considerations:

All the data we used is from Netflix publicly available which has aggregated weekly viewership and ranking information. The dataset includes no personal data hence privacy risks are minimal. The data transformations that were performed is categorizing the language groups, aggregating the weekly values, filtering by top countries were done transparently. One limitation we faced is from Netflix labeling of categories as sometimes they label content inconsistently, such as English vs. Non-English categories. No causal conclusions should be drawn, and recommendations presented are only data informed guidance that should be validated through further experimentation, A/B testing, and internal market research.

Note: Python Code is available in separate markdown file.
